AI at work: the new FOCS recommendations.

Published on 16 October 2026, the FOCS update recalls the questions to settle before entrusting company information to an AI tool.

Publié le 17 octobre 2026 — Imprimé le 27 novembre 2026

The Federal Office for Cybersecurity has published, with the FDPIC, recommendations on the use of AI at work. The central point concerns the information passed to the tools: a message, a document or a spreadsheet can contain personal data, client information or confidential material.

The recommendations to remember

The FOCS notably urges people to review generated results, to check data before entering it, to favour professional tools provided by the company and to know the conditions under which data is used for training.

What this changes in your organisation

For Karbonic, the answer starts with the uses: which tasks should be made easier, which documents are involved and which results must be checked? Tools, access and working rules can then be defined together.

A first trial can use suitable examples, before wider use. Local processing and hosted services are compared on the quality obtained, the costs and the confidentiality required.

Choosing an AI and how to use it
