SOFTWARE

K-Shield: diagnosing a compromised WordPress site.

Software that examines the site and guides its recovery, even when the WordPress administration is inaccessible.

Publié le 16 octobre 2026 — Imprimé le 27 novembre 2026

A compromised site can become inaccessible from its administration. You then need to be able to examine its files and understand the suspicious items through another route.

Diagnosing and guiding recovery

K-Shield Saver can be installed by FTP or SFTP. The site’s files and elements are analysed. The results are presented before the recovery operations. Suspicious items can be quarantined, with the possibility of restoring them.

Adding everyday protection

The Full edition complements this approach with a WordPress plugin, a configurable firewall, login monitoring, backups and diagnostics. A WPSuite console is available as an option.

Choosing the right edition

The features and commercial terms are detailed on WPSuite. After a recovery, checks are still needed to establish the state of the site; automated detection does not by itself prove that every compromise has been removed.
