Software adapted to your work.

Your application is developed from how you use it. Functions, data and access are checked before it goes live.

Version du 27 novembre 2026 — Imprimé le 27 novembre 2026

A usable application, with its instructions, its backups and a defined follow-up.

A case-tracking system, a particular calculation, an interface between two applications: software can be developed around the way you work. An existing application can also be taken over or extended.

Starting from a precise use

The people who will use the software, the data needed and the operations to be carried out are identified with you. The essential functions are chosen for a first version. You can thus check the screens and how it works before extending the project.

Checking what happens behind the screens

Calculations, access rights and data exchanges are tested. Possible errors are also taken into account: missing information, two simultaneous changes or an interrupted connection.

AI can be used to write and review code. Development remains organised around your working rules and around tests whose results can be checked.

Preparing for everyday use

Hosting, backups, updates and support are defined together with the solution. Rights to the source code, data exports and the licences required are set out in the proposal.

Do you already have a prototype?

Its code and how it works can be examined. You receive an explanation of the significant defects, the reusable parts and the work needed to go further.

Questions fréquentes

Can a small application be enough?

Yes. A form, a business calculation or a link between two tools can be a complete project. A first version is defined around the useful result, with the checks and operation it needs.

Can my prototype created with an AI be taken over?

Its operation, its data and its code can be examined. Reusable elements are kept when that makes sense; defects that prevent reliable use are explained before development continues.

How do I stay independent after delivery?

The handover of sources, the rights, the documentation, the exports and the operating instructions are defined at the outset. Updates and support can then be arranged according to the level of independence you want.
